

Changing the course of canine osteoarthritis (OA) treatment...

Introducing
Synovetin OA

1 intra-articular injection delivers up to
1 full year of romps and runs

New Synovetin OA™ breaks the cycle of inflammation and pain, clinically improving mobility and providing long-lasting relief.

Synovetin OA™ is a novel conversion electron therapy:

- Targets macrophages and synoviocytes¹
- An effective option for dogs not adequately treated by current therapies²

Elbow OA is an extremely common and debilitating disorder.³

- Analgesics are often needed as early as 2 years of age⁴
- Fewer than 50% of all treated dogs have satisfactory long-term recovery⁴

Elbow dysplasia is commonly diagnosed in the most popular breeds, which leads to OA oftentimes in young active dogs^{4,5}

Labrador Retrievers

Golden Retrievers

German Shepherds

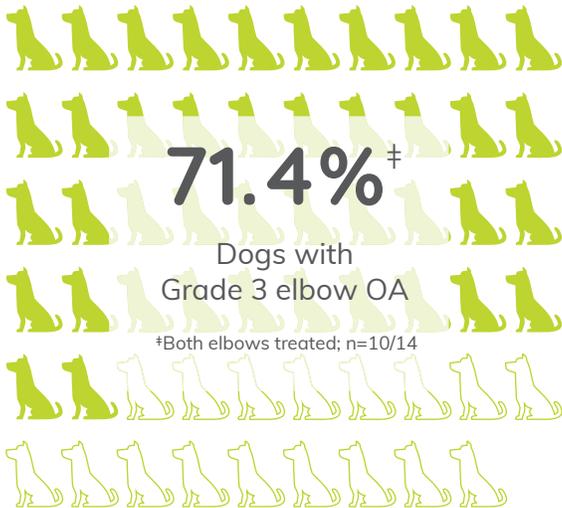

Rottweilers

Contact Gulf Coast Veterinary Specialists
for more information or a patient referral.

Just 1 injection improves mobility for up to 1 year^{1,2}

Overall treatment success^{2*}

*Overall treatment success based on a composite of force plate, Canine Brief Pain Index (CBPI), and clinician assessments for the label dose.

Helps solve areas of unmet need for dogs with chronic OA

For your patients with synovitis and/or elbow OA, Synovetin OA™ offers:

- 1 routine, intra-articular outpatient procedure
- Long-acting efficacy with same-day patient release²
- No significant adverse effects reported by either pet parents or medical personnel²

Visit the Exubrion Therapeutics booth to learn more about breakthrough pain relief...and enter to win a flat screen TV.
